

## The Project - To make sharing ideas fun and simple

*It all started a few months ago as an experiment when I was trying to create my holiday albums but wanted to do a bit more with them than just a slide show.*

### The Idea:

I wanted to develop a framework which could help people create an online presence in a simple, creative and non-technical way. Being a web developer, I endlessly get requests from friends & family to create some kind of online presence for them – a website for a friend's new start-up or an online wedding invite for a cousin! Their needs and requirements are different, so I wanted this tool to give them enough options to customise as well as keep it simple so that everyone can use it.

### The Technical Bit:

SlideRunner is developed using the Microsoft Technology Stack: Microsoft Visual Studio IDE, C#/ASP.NET for the server side programming, HTML / CSS / Javascript / jQuery / AJAX for front-end, and Microsoft SQL Server 2008 R2 for database management.

After endless nights of struggling with AJAX libraries, http-handlers, web-routing, cross-browser compatibility, content management and hundred other bugs, I finally completed developing the SlideRunner CMS and I have recently launched it for beta testing.

### The End-Product:

After months of hard work, patience & perseverance, SlideRunner has turned out to be much better than what I'd expected it to. SlideRunner is a creative and simple way to express yourself online. A responsive design - with every element customisable, SlideRunner CMS helps the user to create a quick online presence in minutes. SlideRunner, with several added functionalities, has much more potential than just a slide show. One can easily customise their webpage to play music, embed videos, create HTML content and use this framework for a varied range of applications.
